Covid-19 evolution, South America (data from JHU CSSE 6/28/20, day 0=1st day with deaths ≥10)

Total number of recovered

Total number of recovered (log scale)

Growth rate (%) of recovered

Acceleration of recovered

Log scale graphs show the rapid increase in the number of recovered cases in the first three weeks of the outbreak, followed by a slower growth rate as the peak is reached. The acceleration graph indicates a significant spike in recovery rates, likely due to increased capacity and better tracking. The growth rate graph is on a logarithmic scale, which highlights the exponential nature of the recovery curve.
